# Mallee Woodbox

We all have our favourite corner of our outdoor space. That place to sit and linger in your garden, soaking up the sun and the positive calming energies that you can only get from nature.

One important aspect for this place is some privacy and shelter. If our gardens do not naturally have secluded inviting nooks and corners, then you have to create them.

Fitting in very well with the genesis of Yagoona - the wood fire grill, the Yagoona Mallee Woodbox system blends 1 solution for 2 problems. Effective and functional firewood storage, and barriers for privacy and protection from wind and weather.

As you expect from Yagoona, our designs contain many hidden features that make our solutions so popular.

The Mallee Woodbox system has 3 different sizes, which are all constructed from just 2 different panels. The result is a system that allows wide flexibility in sizes and uses for garden walls and barriers, while keeping the system easy to install for any handyman or gardener.

We have strategically designed the base size at 65cm allowing for 3 practical height walls: The lowest version is **65cm high**, which is ideal as a sitting bench, or low barrier in your garden. The next level is **130cm high**. This is about head high in the seated position. Ideal for privacy screens around your outdoor dining and relaxing areas. And finally **195cm high** which is a true wall blocking wind, and providing full privacy.

The Yagoona Mallee Woodbox has a unique locking mechanism built into its corners. These neatly join up to neighbouring boxes to create large wall sections from many individual woodboxes.

**Important facts:**

- > Combine the 3 sizes to create larger walls and barriers.
- > Flat packed and delivered quickly to your garden by courier.
- > Easy to assemble with all tools and instructions included.
- > Build walls up to 1.95m high by stacking the boxes.
- > Boxes join together with an innovative locking design.

**Things to know:**

- > Once filled with firewood, the Mallee woodboxes are heavy! We strongly advise working with a qualified garden builder to construct a solid footing to support your Mallee woodbox wall.
- > Free standing walls are prone to windage (movement due to wind). Take precautions to prevent your Mallee woodbox wall from moving in strong wind.
- > Make sure your Mallee woodbox wall is well drained and is not in constant contact with the ground. It is advisable to treat your Mallee woodbox wall with a rust sealer. Ask your local dealer for recommendations.

**Mallee: *Eucalyptus oleosa* and *E. socialis***  
*Aboriginal - type of gum tree found throughout Australia usually near creeks.*

Alex founded Yagoona in 2009, in the heart of the GFC. It all began with a simple idea: how can we make living more **in harmony with nature** cool and desirable?

It started with Alex's passion for grilling and BBQ. For Alex, gas and charcoal were modern distractions. Wood fire, built with your own hands, burning locally grown woods, harvested and processed nearby is as much a part of the grilling culture to Alex, as it is to choose the perfect steak to cook over it. All these aspects are intrinsic to the culture of grilling for him.

Soon thereafter, the iconic Ringgrill and Barramundi BBQ from Yagoona were born. His contribution to the return of simple slow food grilling. Using local raw ingredients, and the raw power of fire!

Alex was still not satisfied with his progress to the goal of **bringing nature gardens into the mainstream**. So he turned his skills to bringing other garden furniture, deliberately designed to complement and enhance habitat, or natural gardens.

This book is a testament to his progress so far, showcasing what Yagoona has managed to bring into production. Alex still dreams about a wider recognition of the importance of the garden space to bring **balance back into our lives** which have been filled with too many artificial chemicals, preservatives and generally products which have been created without thought to how they compliment and coexist with nature in our gardens.

Alex has devoted much energy, thought and care to not only the end product, but the production process. You will not find mass production, nor ridiculous supply chains criss-crossing the globe to bring his products to you. So you can rest assured that the extra you pay for a Yagoona product is devoted to a more holistic mentality to design, materials, production and logistics.

We sincerely hope that you appreciate the care devoted behind the scenes to bring you products that are truly as compatible with nature as practically possible.

# Darri Hockers

When lingering in your garden, its nice to have a place to sit. Hockers are a compact and convenient solution. The Darri Hockers are the Yagoona version of the garden seat. But not just a seat. It's a statement.

Made from **just steel and oak wood**, avoiding all chemical involvement like paints and glues, the base is pure steel while the top is pure untreated oak wood, held together by steel screws. By introducing no artificial chemicals or materials, they balance out longevity with biological compatibility in your garden.

To keep a visual interest and randomness in this product, we made the Darri hocker in 5 subtle variants: **Susan, Nora, Fatima, Walter and Chuck**. The names signify the individual characters of each design. While looking great all on their own, they come together as a community when in a group together.

Despite its construction, the Darri hocker is surprisingly resilient to the weather and can generally be left outside year round.

**Coolibah** (or *Coolabah*): **Eucalyptus coolabah**  
Aboriginal - Large hardwood eucalypt occurring on occasionally flooded heavy-soiled plains and banks of intermittent creeks.

# Coolibah Table

The Coolibah tree is an icon of the tough, wild, nature in Australia. A majestic giant tree with characterful hardwood that has been immortalised in classic Australian wooden furniture for centuries. We have borrowed this name for our design outdoor table.

Taking the material pallet from the Darri Hockers, the Yagoona Mallee table is made from **just steel and oak wood**. Garden furniture made from fully natural

and biodegrading materials is a rarity today, with such furniture being made from any number of artificial materials being the norm. We do not believe such materials are a healthy match for the natural fauna and flora in your habitat garden.

We created the Coolibah Table as the perfect centerpiece for your natural garden outdoor space. Solidly constructed, from thick steel and heavy raw oak planks, and featuring subtle design accents harking back to the quality hand carpentry of yesteryear.

When you bring the Coolibah table into your garden, it is quickly adopted by nature as a welcome member outdoor ecosystem. It will age gracefully and blend into your outdoor space providing years of function and aesthetic beauty.

The Yagoona Coolibah table will forever stand as a testament to your philosophy of commitment to living in harmony with nature in your habitat garden.

### Important facts:

- > Big is beautiful! The standard Coolibah table has a top of 250 x 125cm (8-10 person capacity).
- > Use your own existing wood top. The Coolibah Table legs and frame sold separately.
- > We suggest treating the legs and frame once rusty to rust staining on the ground.
- > Oak will cause black stains while it is weathering.

### Things to know:

- > To make delivery more gentle on the environment and your pocket, the Coolibah table will be delivered in parts.
- > Most of the assembly can be done by one person, but turning over the table and positioning will require help.
- > It is advisable to treat the legs and frame with a rust sealer. Ask your local dealer for recommendations.

A photograph of a stone staircase leading up a hillside through a lush forest. The path is made of large, flat stones and is flanked by a stone wall on the left and dense green foliage on the right. The scene is bathed in soft, dappled sunlight, creating a serene and inviting atmosphere. The sky is a clear, bright blue, visible through the trees in the upper right corner.

Take the journey  
with us

nature beckons!

# Growcube

So many people live in constrained environments which mean garden space is a premium. Even though any outdoor space can become a garden, small spaces do pose a challenge if you wish to have a productive patch of garden for growing fruits, vegetables and herbs. How to get the most out of your space? We love such design challenges!

The Yagoona Growcube was developed to greatly expand the productive surface of your garden with a particular focus on food gardening. The Yagoona Growcube has a few features which greatly expand the function of your outdoor space.

As a raised bed, it offers a deep planting surface **80cm above the natural ground**. A comfortable standing height for garden work. The top surface area of the smallest unit of the Growcube is **80 x 80cm**. So the base Yagoona Growcube is a neat 80cm cube. This base unit can be expanded in any direction with additional growcube elements. Straight rows, L and C shapes, or your own growcube labyrinth are all possible. This really opens up a host of design possibilities.

The real innovation with the Growcube are the sides. Most raised beds that close in the earth behind stylised panels, the Yagoona Growcube opens them up to more planting space. 4 heavy steel slats hold back the earth while offering a terraced growing space. The plants' roots can venture deep into the interior of the structure while the foliage grows out of the sides of the Growcube creating the impression of a growing wall.

If you are tired of the plastic compost bins that break after only a few years and never really look like part of your garden? Maybe take a look at the Growcube.

The Yagoona **Growcube** was designed to **double as a compost bin**, with some cool new features.

Because of its open sides, the Growcube lets your compost breathe more freely promoting healthy decomposition with minimal bad smells. The open sides also offer you easy access to all sides so you can harvest the new rich soil your compost bin has made for your garden. And as a bonus, you will find seeds you threw out in your compost may begin to grow out from the sides in a burst of fertile flurry.

We accidentally discovered that seeds from fruit and nut trees such as Avocado find this a perfect environment to germinate. Others have found rapid growing vines like pumpkin and watermelon thrive in the lower levels of the Growcube's rich compost soil and produce exceptional fruits.

It did not take long for intrepid garden designers discovered that the Yagoona Growcube can also emulate a retaining wall of sorts. This idea has been expanded on to create the Yagoona Green Wall system. See page X for more details.

### Important facts:

- > Virtually any configuration based on the 80 x 80cm square base unit are possible.
- > Extremely compact when disassembled makes logistics and handling easy.
- > Virtually unbreakable, the heavy steel construction is very tough.
- > Despite this, no part is too heavy for anyone to be able to handle.
- > New soil can be easily extracted from lower levels (when used as compost bin).
- > Healthy air circulation means no need to turn your compost periodically.

### Things to know:

- > All parts are from heavy steel plate.
- > No small breakable parts that can be easily fail or be lost.
- > Extremely easy assembly that can be completed by anyone.
- > Safe for nature and for your health with no artificial or chemical treatments or coatings.

*The Yagoona Growcube and Green Wall are complementary earth management products for the natural garden. They will add great value, both aesthetically, and practically to your garden.*

# Green Wall

Quite often during garden projects, the need to form earth into leveled areas is needed. Even modest slopes can significantly reduce the function of your garden space.

The cost and complexity of retaining walls can be very high. They often require extensive excavations, large stones, and a lot of concrete. Heavy machinery is often needed to complete these operations. So your choices for retaining walls are limited and usually expensive and complicated.

Some intrepid gardeners have taken the Yagoona Growcube adapting it as a kind of retaining wall. We took notice of this and designed the Yagoona Green Wall.

The Yagoona Green Wall can retain earth levels of up to 80cm in height. The system does not rely on extensive underground anchoring foundations for its strength, but rather the weight of earth on the retaining anchors of the system which are buried behind the wall. This concept is not new, but is usually only applied in large civil engineering projects such as motorways.

This results in far lower project cost and faster execution. A low environmental impact retaining wall solution that can be constructed without the need for large rocks or panels, concrete footings, machinery or any special drainage. The entire system is delivered in a compact package and can be assembled completely by hand.

With time the Yagoona Green Wall becomes a living wall. The Green Wall's vertical face invites you to create a fantastic living wall filled with small plants, vines, flowers and herbs. The plant roots tap into a deep reservoir of moisture trapped beneath the upper level. When your plants mature the structure of the Green Wall virtually vanishes from sight as the plants cover the wall completely.

### Important facts:

- > Made from thick steel plate for high durability.
- > Maximum height 80cm and each bay is 100cm wide.
- > No concrete foundations required, only some concrete pavers under upright frames.
- > All parts are easily man handleable.
- > No small screws or clips that can break or be lost.

### Your project

*Each installation is unique. We only give indicatory prices for a single section of Green Wall.*

*With your cooperation, we will be happy to calculate your requirements and supply you with **a quotation for your project.***

### Things to know:

- > Reinforcement ties extend approx 1m behind upper side of the Green Wall.
- > We strongly advise working with or consulting a qualified gardener before installation.
- > Earth must be compacted well in layers behind the wall.
- > All retaining walls can fail in extreme conditions. When poorly constructed, they will fail more readily. If you plan to construct your Green wall with no professional help, we are no longer liable for failures or injuries.
- > It is a vital part of your planning to correctly analyse the risks of your particular use case.
- > The Greenwall is made from untreated steel plate. Even though your Green wall will last many years, eventually the metal structure will rust away and need to be replaced.

## Buying and Ordering

Yagoona products are **available worldwide**. We are represented in various parts of the world by passionate and dedicated distributors, and in other regions we have active resellers and affiliate dealer networks. Because our networks are always changing, the most up to date information can be best found on our website. Alternatively, you can reach out to us directly by email where we will do our best to link you with the most appropriate sales channel where you will find pricing and delivery information.

If you are a **landscape designer, gardener, or just a passionate habitat gardener** with a social media following looking for supplemental income, then **we are looking for you**. Visit our site and download the "Become a Yagoona Affiliate" booklet on our programs and learn more.

*Bring nature  
back into your life.*
